Subject: Issue with Login Functionality and OTP Verification in Automation Assignment

Dear Chetan,

I hope this email finds you well.

I am writing to inform you about an issue I have encountered while working on the assigned automation assignment involving the Goibibo website. The assignment requires performing sign-up and login operations, followed by other tasks. However, I am consistently facing a problem when attempting to log in.

When navigating to the website and clicking on the login text field to enter the mobile number, I receive the error message: "Some error occurred, please try again." I have tried using different mobile numbers and different browsers, but the issue persists.

Additionally, the login functionality requires entering an OTP for user verification. In the context of automation, we face the challenge of not being able to automate the OTP text field.

Given these obstacles, I am unable to proceed with the remaining operations required for the assignment. I kindly request your assistance in resolving this issue or providing an alternative solution to bypass the OTP verification step in the automation process.

I would appreciate any guidance or suggestions you can offer to help me successfully complete the assignment.

Thank you for your understanding and support.

Best regards,

Virendra Kumar
